

1. Demo to understand different Big O complexity in linear data structure
2. DEMO to different Static and dynamic Array in C
3. Demo to implement Linked list in C with standard operations
4. Demo to implement Stack Queue using Arrays and Linked List

//Steps for performing Array Rotation based on user input

//Step 1: Read array size

//Step 2: Input array elements

//Step 3: Read number of positions to rotate

//Step 4: Rotate the array by K positions

```
for(int r = 1; r <= k; r++)
{
    // Save last element
    temp = arr[size - 1];

    // Shift all elements to the right
    for(int i = size - 1; i > 0; i--)
    {
        arr[i] = arr[i - 1];
    }

    // Place last element at first position
    arr[0] = temp;
}
```

//ArrayRotation is a process of shifting the elements of an array to the left or right by a certain number of positions. In this case, we will rotate the array to the right by K positions.

Example: Input : 10 20 30 40 50

K = 2 Output : 40 50 10 20 30
